2

alerts sent in the last hour

Memory 1596 of 3908 MB used. Load average 0.84, 2.28, 2.04. Routine feed reconnects in the last hour: 14. Every service is running.

## 1. Services

| Service         | State          | Running for | Restarts | Memory |
|-----------------|----------------|-------------|----------|--------|
| s1-harness      | <b>RUNNING</b> | 2.3 days    | 0        | 25 MB  |
| s1-trader       | <b>RUNNING</b> | 2.3 days    | 0        | 22 MB  |
| s9-watcher      | <b>RUNNING</b> | 2.3 days    | 0        | 167 MB |
| bme-capture     | <b>RUNNING</b> | 2.3 days    | 0        | 380 MB |
| s3-maker        | <b>RUNNING</b> | 1.1 days    | 0        | 29 MB  |
| s2-collect      | <b>RUNNING</b> | 20 min      | 28       | 19 MB  |
| s46-harvester   | <b>RUNNING</b> | 1.1 days    | 0        | 30 MB  |
| s5-collector    | <b>RUNNING</b> | 3.5 h       | 1        | 120 MB |
| s8-router       | <b>RUNNING</b> | 1.1 days    | 0        | 13 MB  |
| s10-box         | <b>RUNNING</b> | 1.1 days    | 0        | 30 MB  |
| s1-monitor      | <b>RUNNING</b> | 1 min       | 0        | 308 MB |
| ms-us-recorder  | <b>RUNNING</b> | 1.2 h       | 0        | 27 MB  |
| ms-nws-watch    | <b>RUNNING</b> | 1.2 h       | 0        | 51 MB  |
| ms-regime-watch | <b>RUNNING</b> | 47 min      | 0        | 27 MB  |

s2-collect and s5-collector restart on purpose at the end of each recording session, so their restart counts grow by design.

## 2. Strategies

| S1 TWAP Lock-In                                                                                                                                                                       |                                       |
|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------|
| observer + DRY trader. Records every BTC 5m/15m round and tests which settlement rule Polymarket really uses (verdict: end-value, not the average). Trader is hard-blocked from live. |                                       |

| <b>Today's file</b> | 922 MB                                        |
| <b>Disk free</b>    | 168.6 of 193 GB (87%)                         |
| <b>7-day gate</b>   | day 7 of 7 (complete, 7 days recorded)        |

## S3 Fee-Farm Two-Sided Maker

rests a buy at 0.45 on BOTH sides of each BTC 5m/15m round during quiet hours, keeps completed pairs (0.90 -> 1.00), cuts stray legs after 20 s, and pulls its quotes on liquidation cascades / spot jumps (Moon Dev feed). DRY: fills are simulated from the public tape.

|                        |                                                                                                                                      |
|------------------------|--------------------------------------------------------------------------------------------------------------------------------------|
| <b>Last hour</b>       | 6 quotes, 0 dry fills in 0 rounds, 0 pairs, 0 cuts, pulls BAND_EXITx2, skipped rounds 7 (price outside the quoting bandx7), errors 0 |
| <b>Trading session</b> | quiet (quoting allowed)                                                                                                              |
| <b>Heartbeat</b>       | 0 min ago                                                                                                                            |

## S2 Open-Print Displacement (research recorder, NO orders)

10 s after each BTC 5m/15m round opens it records the Chainlink spot vs the open, the TWAP feed, and the order book on the displaced side, then applies the strategy gates (5/8 bps move, ask <= 0.60, 2 s freshness) and logs a hypothetical candidate or the skip reason. Outcomes are joined later for replay.

|                         |                                                                                                                                                           |

| <b>Mode</b>             | KILL=no                                                                                                                                                   |

## S8 Session Regime Router (gate, NO orders)

decides which strategies may trade right now from the clock (Asia 00-12 UTC and weekends = makers on; US 13:30-21:00 = takers on, makers off), a hardcoded US macro calendar (blackout +/-1 round around releases: everything off) and trailing 1 h volatility (>10.5 bps flips to US mode). S3 asks it before every quote.

|                                 |                                            |
|---------------------------------|--------------------------------------------|
| <b>Regime</b>                   | ASIA (Weekend (Sunday): Asia-mode all day) |
| <b>State age</b>                | 3 s old                                    |
| <b>Volatility</b>               | 7.73 bps [kraken_1m] override off          |
| <b>Allowed now</b>              | S3, S5, S6                                 |

| <b>Errors</b>                   | 0                                          |
| <b>Mode</b>                     | KILL=no                                    |

## S46 Paired = S6 coin-flip maker + S4 Liquidation Cascade Continuation (15m only)

the same \$1.5M/10 s liquidation cascade that pulls the S6 quotes is S4's entry signal - if spot confirms the direction by 2 bps and the 15m continuation side still asks <= model odds minus fee minus 2c, S4 buys it (taker) and holds to resolution. DRY: no real orders; S4 triggers are rare on a quiet tape by design.

|                         |                                                                                                                                        |

## S5 Wick Fade / Tape-Lag Reversion (research recorder, NO orders)

records every Kraken BTC trade and every Polymarket order-book change for the current 5m round, so a replay can find sharp spikes that snap back within seconds (wicks) and measure whether the Up/Down quotes lagged. No fair-value model exists yet, so all entries are blocked by design.

|                     |                                                                                                                                   |

## S10 Vol-Event Binary Box ('own the whipsaw, don't guess it')

stays flat until a US macro release (8:30 / 10:00 / 14:00 ET, weekdays) or a volatility spike arms 'box mode'; then rests a buy at 0.45 on BOTH sides of the BTC 15m (and 5m) round and buys both sides outright whenever the combined ask is under \$0.97 after fees. A lone filled leg is chased within 60 s or unwound - it never carries a naked position. DRY: no real orders, fills simulated from the public tape.

|                     |                                                                                                                                                                                                            |

| <b>Settlement calculator check</b>      | 1 of 200 rounds compared, agrees on 1 (100.0 %). Verdict: NOT READY: fewer than 200 comparisons                                                              |
| <b>Weather watcher</b>                  | heartbeat 22 s ago; 60 of 60 temperature markets quoted; forecast updates seen 6; buy-every-bucket flags 0; NWS call errors 0                                |
| <b>Rule-change watcher</b>              | heartbeat 378 s ago; sources healthy 12 of 12; changes in the last cycle: none                                                                               |
| <b>7-day backtest (S1, true labels)</b> | 78 trades, 75.64 % wins against 82.58 % needed, net \$-56.57 after fees. Public labels disagreed with the blockchain on 254 rounds.                          |

## 4. Errors and alerts in the last hour

No errors in any log in the last hour.

| Routine feed reconnects  | Count | What happened                                 | Last at (UTC) |
|--------------------------|-------|-----------------------------------------------|---------------|
| <b>BME book recorder</b> | 5     | server dropped a slow connection, reconnected | 13:23:16      |
| <b>S1 trader</b>         | 4     | server closed the connection, reconnected     | 12:29:55      |
| <b>S3 fee-farm maker</b> | 2     | server closed the connection, reconnected     | 12:44:01      |
| <b>S10 vol-event box</b> | 2     | server closed the connection, reconnected     | 12:55:25      |
| <b>S1 observer</b>       | 1     | server closed the connection, reconnected     | 12:35:44      |

These are not errors. The price and order-book servers close connections from time to time and every recorder reconnects by itself within seconds.
